

[https://yopad.eu/p/Quick Git Chat](https://yopad.eu/p/Quick_Git_Chat)
<https://github.com/>

1. Github.com --> get an account w. your (private) email
2. bwjupyter or IDE on your laptop, as long as you can open an terminal AND have internet connection
3. establish ssh connection between you and the Github platform
check if ~/.ssh exists (command: cd ~/.ssh)
if none exists:
 generate one ssh-key pair (command: ssh-keygen)
if exists:
 use command cat to show what's inside of the .pub file
 copy that (your public key)
 navigate, inside browser, to your github account's setting [left panel, look for ssh key], add your public key.
4. Navigate/create a Github folder, go in that folder [command: cd FOLDERNAME]

NOW, all the git commands we used today:

- git clone [whatever you copied from github website after clicking that green button "code"]
- git status
- git add FILENAME
- git commit -m "MEANINGFUL MESSAGE"
- git push

other commands we used today that can be used in Terminal to impress a friend:

```
cd
ls
mkdir
cat
cd ..
touch
echo "some meaningful strings" > FILENAME.txt
```

When in doubt, copy+paste and ask claude/GPT.
